

TRIUNE PRODUCTS

Features

- Low Offset
- High Voltage Input
- Supply voltage: 4V-42V
- Low Temperature Drift
- Low input bias current
- Pedestal Voltage for offset compensation
- Available in 8-pin SOT-23 package
- Product is lead-free, Halogen Free, RoHS / WEEE compliant

Applications

- Multi-standard compliant and non-compliant wireless chargers for:
 - Cell Phones and Smartphones
 - Qi-Compliant Wireless Charging Transmitters
 - o Tablets and eReaders
- Notebook Computers
- Telecom Equipment
- Power Management
- Battery Chargers
- Welding Equipment

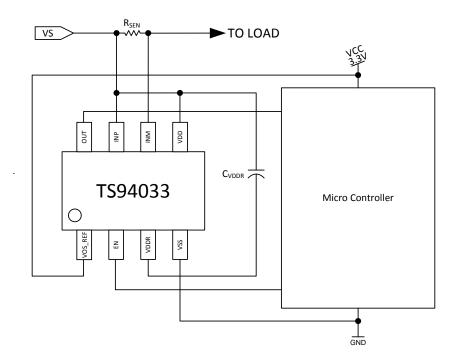

Description

The TS94033 is a low power, low offset high-side current sense amplifier. It utilizes a chopper-stabilized configuration to provide high gain-bandwidth while reducing input offset and 1/f noise. The sense amplifiers offer high voltage inputs and a 0 to 3.3V output. The supply voltage range of 4V to 42V can accommodate a wide variety of applications.

A zero-current output offset is set by providing a bias voltage on the VOS_REF pin. This allows the ability to sense limited negative currents, improves transient response time, and provides a method to detect faults in the current sense system.

The TS94033 operational amplifier is optimal for bridge drive applications where accurate current sensing is needed.

Notes:

- (1) Stresses beyond those listed under "absolute maximum ratings" may cause permanent damage to the device. These are stress ratings only and functional operation of the device at these or any other conditions beyond those indicated under "recommended operating conditions" is not implied. Exposure to absolute–maximum–rated conditions for extended periods may affect device reliability.

Operational Modes

The TS94033 is a low power, low offset high-side chopper-stabilized current sense amplifier. The amplifier is supplied on the high-side from the VDD pin and a sub-regulated supply that is generated at the VDDR pin. It is necessary for good supply rejection to have a bypass capacitor, C_{VDDR}, closely-coupled between the VDD and VDDR pins.

The INP and INM pins are used to sense the voltage drop across a current-sensing resistor. Though it is usually the case that the INP pin would be connected to the VDD pin, the common-mode voltage can extend above and below VDD as specified by the V_{CM} parameter.

The EN pin may be used to set the device into a low-quiescent current mode when asserted low.

A zero-current output offset is set by providing a bias voltage on the VOS_REF pin. The zero-current offset voltage can be determined by the following relation:

$$V_{OS} = 0.065152 * V_{OS_REF}$$

The output voltage at the VOUT pin is referenced to the VSS pin. The VSS pin should be closely coupled to the circuit monitoring this voltage. The VOS_REF should be bypassed to this VSS as well.
